AI ASSISTANT CODING
ASSIGNMENT-17.2

Name: S.Kirthan

Enrollment no: 2303A52157

Batch: 34

Semester: VI

Branch: CSE(AIML)

Lab 17 – AI for Data Processing: Data Cleaning and Preprocessing Scripts

Task Description – 1(Student Academic Data Cleaning)

• Task: Use AI assistance to generate a Python script that cleans and prepares a student academic dataset for analysis.

Instructions:

• Handle missing values in marks, attendance, and department.

• Remove duplicate student records based on student ID.

• Standardize text fields such as department names.

• Encode categorical variables like gender and department.

Sample Code:

```
import pandas as pd

data = pd.read_csv("students.csv")

print(data.head())
```

Expected Output:

• A cleaned and encoded Pandas DataFrame suitable for academic

performance analysis.

```python
import pandas as pd
import os
if not os.path.exists("students.csv"):
    print("students.csv not found. Creating a dummy file for demonstration.")
    dummy_data = {
        'student_id': [1, 2, 3, 4, 5, 6],
        'marks': [85, 70, None, 92, 78, 65],
        'attendance': [90, 85, 70, None, 95, 80],
        'department': ['cse', 'ece', 'CSE', 'EEE', 'CS', None],
        'gender': ['male', 'female', 'male', 'female', 'male', 'female']
    }
    pd.DataFrame(dummy_data).to_csv("students.csv", index=False)
# Load dataset
data = pd.read_csv("students.csv")
display(students_df)
print("Original Data:\n", data)
data['marks'] = data['marks'].fillna(data['marks'].mean())
data['attendance'] = data['attendance'].fillna(data['attendance'].median())
data['department'] = data['department'].fillna(data['department'].mode()[0])

data = data.drop_duplicates(subset='student_id')
data['department'] = data['department'].str.lower().str.strip()

data['department'] = data['department'].replace({
    'cse': 'computer science',
    'cs': 'computer science',
    'ece': 'electronics',
    'eee': 'electrical'
})
data['gender'] = data['gender'].map({'male': 0, 'female': 1})
data = pd.get_dummies(data, columns=['department'])
print("\nCleaned Data:\n", data)
data.to_csv("cleaned_students.csv", index=False)
```

	student_id	marks	attendance	department	gender
0	1	85.0	90.0	cse	male
1	2	70.0	85.0	ece	female
2	3	NaN	70.0	CSE	male
3	4	92.0	NaN	EEE	female
4	5	78.0	95.0	CS	male
5	6	65.0	80.0	NaN	female

```
Original Data:
   student_id  marks  attendance department  gender
0           1   85.0        90.0        cse    male
1           2   70.0        85.0        ece  female
2           3    NaN        70.0        CSE    male
3           4   92.0         NaN        EEE  female
4           5   78.0        95.0         CS    male
5           6   65.0        80.0        NaN  female

Cleaned Data:
   student_id  marks  attendance  gender  department_computer science  \
0           1   85.0        90.0       0                         True
1           2   70.0        85.0       1                        False
2           3   78.0        70.0       0                         True
3           4   92.0        85.0       1                        False
4           5   78.0        95.0       0                         True
5           6   65.0        80.0       1                         True

0                  False                   False
1                  False                    True
2                  False                   False
3                   True                   False
4                  False                   False
5                  False                   False
```

Task Description – 2 (Financial Transaction Data Preprocessing)

- **Task:** Preprocess financial transaction data using AI-generated Python code.

Instructions:

- Convert transaction date columns to datetime format.
- Create derived features such as transaction month and year.
- Normalize the transaction amount column.
- Identify and handle extreme transaction values.

Sample Code:

import pandas as pd

from sklearn.preprocessing import MinMaxScaler

transactions = pd.read_csv("transactions.csv")

print(transactions.info())

Expected Output:

• A transformed dataset with normalized values and newly generated time based features.

	amount_normalized
0	0.013681
1	0.082086
2	1.000000
3	0.027362
4	0.061565
5	1.000000
6	0.000000
7	0.010261
8	1.000000
9	0.034203
10	0.020522
11	0.099188

Task 3 – (Environmental Sensor Data Preparation)

• Task: Clean and preprocess environmental sensor data using AI-assisted scripts.

Instructions:

• Handle missing values in temperature, humidity, and air_quality_index.

• Scale numerical features using standard scaling.

• Encode categorical fields such as sensor_status.

• Split the dataset into training and testing subsets.

Sample Code:

import pandas as pd

from sklearn.model_selection import train_test_split

data = pd.read_csv("sensor_data.csv")

Expected Output:

• A fully preprocessed dataset ready for predictive modeling tasks.

```python
# 5. Split Dataset
X = df.drop(columns=['sensor_id'])  # features
y = df['sensor_status']             # target

X_train, X_test, y_train, y_test = train_test_split(
    X, y, test_size=0.2, random_state=42
)

# 6. Output Results
print("\nPreprocessed Data:\n", df)
print("\nTraining Set Shape:", X_train.shape)
print("Testing Set Shape:", X_test.shape)
```

```

Task 4 – (Real-Time Application: Smart City Traffic Data Cleaning)

• Scenario:

A smart city system collects traffic data from multiple sensors, resulting in noisy and inconsistent records.

Requirements:

• Standardize road and location names.

• Fill missing traffic density values using appropriate statistical methods.

• Remove duplicate sensor readings.

• Normalize speed and vehicle count metrics.

• Generate a brief summary comparing dataset quality before and after cleaning

Sample Code:

```
import pandas as pd

traffic = pd.read_csv("traffic_data.csv")

print(traffic.describe())
```

Expected Output:

• A cleaned and normalized traffic dataset with an accompanying

data-quality improvement summary.

Task 5 – (Social Media Text Data Cleaning and Feature Extraction)

• Task:

Use AI-assisted Python scripting to clean and preprocess social media text data for sentiment analysis.

Instructions:

• Remove duplicate posts and null text entries.

• Clean text by removing URLs, special characters, and extra spaces.

• Convert text to lowercase and perform basic tokenization.

• Remove stopwords and perform stemming or lemmatization. Generate basic text features such as word count and sentiment score.

Sample Code:

```
import pandas as pd

import re

posts = pd.read_csv("social_media_posts.csv")

print(posts.head())
```

Expected Output:

A cleaned text dataset with extracted features suitable for sentiment analysis models.
